For $T \in A \otimes B \otimes C$ a concise tensor

Definition

 $Ann(T) = \{x \in Sym(A^*) \otimes Sym(B^*) \otimes Sym(C^*) | x.T = 0\}$

- $\label{eq:analytical_states} I \subset Ann(T) \text{ i.e. } I_{110} \subset T(C^*)^{\perp} \text{, etc. and } I_{111} \subset T^{\perp}$
- **②** For all i, j, k such that i + j + k > 1, then codim $I_{ijk} = m$
- **③** The image of the multiplication map $I_{i-1,j,k} \otimes A^* \oplus I_{i,j-1,k} \otimes B^* \oplus I_{i,j,k-1} \otimes C^* → S^i A^* \otimes S^j B^* \otimes S^k C^*$ is contained in I_{ijk}

We refer to the codimension criterion at (i, j, k) grade as ijk-test.

Let $T \in A \otimes B \otimes C$ concise, 1_A -generic, and $\alpha_1, \dots, \alpha_m$ a basis of A^* with $T_A(\alpha_1)$ full rank. Consider $\langle Id_{B^*}, M_2, \dots, M_m \rangle \subset \text{Hom}(B^*, B^*)$, where $M_i = T_A(\alpha_1)^{-1}T_A(\alpha_i)$.

• T is rank $m \iff M_i$'s simultaneously diagonalizable.

 T is border rank m ↔ M_i's are in the closure of the space of simultaneously diagonalizable matrices.

Apolarity Lemma

Let $S = \mathbb{C}[x_1, \ldots, x_n]$ and $T = \mathbb{C}[y_1, \ldots, y_n]$. Define T action on S as $y_i \cdot x_j = \frac{\partial}{\partial x_i} x_j$. Let $f \in S_d$ and $f^{\perp} := \{t \in T | t \cdot f = 0\}$ be called the apolar ideal of f.

Apolarity Lemma

 $f \in \langle l_1^d, \dots, l_r^d \rangle \iff f^\perp$ contains an ideal of r distinct points.

End Closed Condition

End Closed Condition

Let $T \in A \otimes B \otimes C$ be a concise 1_A -generic tensor and $\alpha \in A^*$ such that $T_A(\alpha)$ has full rank. Then $T(\alpha)^{-1}T_A(A^*)$ is a subalgebra of $\operatorname{Hom}(B^*, B^*)$.

back

Flag Condition

Let $T \in A \otimes B \otimes C$ be a concise tensor. Then if $\underline{R}(T) = m$ there exist $A_1 \subset A_2 \subset \cdots A_m = A^*$ such that $\dim(A_i) = i$ and $T_A(A_i) \subset \sigma_i(\mathbb{P}B \times \mathbb{P}C)$.

back

Theorem ([Friedland], Thm 3.1)

Let $T \in A \otimes B \otimes C$ be 1_C -degenerate and rank of elements of $T_C(C^*)$ are bounded by m-1 but not by m-2. Then there exist bases of A, B, C such that, letting X_1, \dots, X_m be a basis of $T_C(C^*)$ as a space of matrices,

 $X_1 = \begin{pmatrix} Id_{m-1} & 0 \\ 0 & 0 \end{pmatrix}$ $\mathbf{2} \ X_m = \begin{pmatrix} \mathbf{x}_m & e_1 \\ e^{m-1} & 0 \end{pmatrix}$ So For all $2 \le s \le m-1$, $X_s = \begin{pmatrix} \mathbf{x}_s & 0 \\ 0 & 0 \end{pmatrix}$. Here $e_1 = (1, 0, \dots, 0)^t \in \mathbb{C}^{m-1}$, $e^{m-1} = (0, 0, \dots, 1) \in \mathbb{C}^{m-1*}$. $\mathbf{x}_i \in Mat_{(m-1)\times(m-1)}$ Moreover, let $U_R = \langle \mathbf{x}_m^j e_1 | j \in \mathbb{Z}_{\geq 0} \rangle \subset \mathbb{C}^{m-1}$ and $U_L = \langle e^{m-1} \mathbf{x}_m^j | i \in \mathbb{Z}_{\geq 0} \rangle \subset \mathbb{C}^{m-1*}$. Then $e^{m-1} U_R = 0, U_L e_1 = 0$ and $\mathbf{x}_{s}U_{B} = 0 = U_{L}\mathbf{x}_{s}$ for $2 \le s \le m - 1$.

back

◆□▶ ◆□▶ ◆豆▶ ◆豆▶ ◆□ ● ○○○

Consider: $T = (e_1 \otimes e_1 \otimes e_2) + (e_1 \otimes e_2 \otimes e_1) + e_2 \otimes e_1 \otimes e_1) \in \mathbb{C}^2 \otimes \mathbb{C}^2 \otimes \mathbb{C}^2$.

Rank 3 as $\begin{pmatrix} a & b \\ b & 0 \end{pmatrix}$, $a, b \in \mathbb{C}$ can not be written as sum of two rank one matrices.

Border rank 2 as $T(\epsilon) = \frac{1}{\epsilon} [(e_1 + \epsilon e_2) \otimes (e_1 + \epsilon e_2) \otimes (e_1 + \epsilon e_2) - e_1 \otimes e_1 \otimes e_1]$ and $T(\epsilon) \to T$ as $\epsilon \to 0$.

back

(四) (王) (王) (王)

Let $T \in A \otimes B \otimes C$ and $T = \sum_{i=1}^{r} a_i \otimes b_i \otimes c_i$ be a rank decomposition.

Definition

T is concise if $\{a_1, \dots, a_r\}$ spans A, $\{b_1, \dots, b_r\}$ spans B, and $\{c_1, \dots, c_r\}$ spans C.

伺下 イヨト イヨト

Working over \mathbb{C} .

The join of two varieties $Y, Z \subset \mathbb{P}V$ is $J(Y, Z) = \overline{\bigcup_{x \in Y, y \in Z, x \neq y} \mathbb{P}^1_{xy}}$. The *r*-th secant variety of a variety $X \subset \mathbb{P}V$ is

$$\sigma_r(X) = \overline{\bigcup_{P_1, \cdots, P_r \in X} \langle P_1, \cdots, P_r \rangle} = J(Y, J(Y, \cdots))$$

Fact: Joins and Secants of irreducible varieties are irreducible. **Fact:** $X = Seg(\mathbb{P}V_1 \times \cdots \times \mathbb{P}V_n)$, then Euclidean and Zariski closure of X agree for $\sigma_r(X)$. **Sketch:**

- Euclidean closure is contained in Zariski closure.
- Z an irreducible variety and $U \subset Z$ a Zariski open subset then $\overline{U} = Z$ in terms of Zariski closure and Euclidean closure.
- For X take U to be set of rank at most r tensors.

・ 同 ト ・ ヨ ト ・ ヨ ト …

Expected Dimension:

• For $\sigma_r(X)$ is $\min\{rn + r - 1, N\}$, where $X \subset \mathbb{P}^N$ and $\dim(X) = n$. Defect $\delta_r := rn + r - 1 - \dim \sigma_r(X)$.

Theorem (Terracini's Lemma)

Let $P_1, \cdots, P_r \in X$ be general points and $P \in \langle P_1, \cdots, P_r \rangle \subset \sigma_r(X)$ a general point. Then

$$T_P(\sigma_r(X)) = \langle T_{P_1}(X), \cdots, T_{P_r}(X) \rangle$$

Consequence: $\delta_r(Seg(\mathbb{P}A \times \mathbb{P}B)) = r^2 - r$ **Consequence:** m > 2 and $r \le \min\{\dim V_i\}$ then $\sigma_r(Seg(\mathbb{P}V_1 \times \cdots \times \mathbb{P}V_m))$ is not defective.
